Site 2: Smal, A mini-library was made by cloning products derived from ORESTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the pUC 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under low stringency conditions."

The present invention relates to chemically modified DNA sequences of signal transduction associated genes. The DNA sequences are chemically modified using a solution of bisulphite, hydrogen sulphite or disciplinte.

Maso disclosed are oligonucleotides and/or PNA oligomers for detecting the cytosine methylation state (CpG islands) of these genes, and a method for the diagnosis and/or therapy of genetic and epigenetic parameters of genes associated with signal transduction. The genomic DNA can be obtained from cells or cellular components which contain DNA, e.g. cell insue biopsies, blood, sputum, stool, urine, cerebral-spinal fluid, issue embedded in paraffin such as tissue from eyes, intestine, kidney, brain, heart, prostate, lung, breast or liver, histologic object slides, and all their possible combinations. The sequences of the invention are useful for the diagnosis and therapy of diseases associated with signal transduction e.g. solid tumours and cancer. ABK31158-ABK311545 represent chemically pretreated genomic DNA sequences of different genes associated

The invention relates to a nucleic acid comprising a sequence of at least with cell signaling. The activity of the modified sequences of the invention may be described as cytostatic. The object of the invention is to provide the chemically modified DNA of genes associated with cell signalling, as well as objectnollectides and/or DNA-digomers for particularly suitable for the diagnosis and/or DNA-digomers for particularly suitable for the diagnosis and/or therapy of genetic and epigenetic parameters of genes associated with cell signalling. The chemically modified DNA provided by the invention is useful for diagnosis and therapy of diseases such as solid tumours and cancer. The sequences given in records ABL7011-ABL70626 represent chemically pre-treated genemic DNA's of genes associated with cell signalling. Note requence data for this patent is not represented in the printed sequence in sequence information supplied by the
                                                                                                                                                                                                                                  9482
                                                                                                                                                            ó,
                                                                                                                                                                                                09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytosine methylation; cell signalling disease; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid, useful for diagnosis and therapy of diseases associated with cell signaling e.g. cancer, comprises chemically modified genomic sequences of genes associated with cell signaling.
             sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid rebuxaemia, Alzheimer's disease, Alzheijepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

The DNA sequences are chemically modified using a solution of bisulphite, hydrogen sulphite or disulphite. Also disclosed are oligonucleotides and/or PNA oligomers for detecting the cytosine methylation state (CpG islands) of these genes, and a method for the diagnosis and/or therapy of genetic and epigenetic parameters of genes associated with signal transduction. The genomic DNA can be obtained from cells or cellular components which contain DNA, e.g. cell lines, biopsies, blood, sputum, stool, urine, cerebral-spinal fluid, tissue embedded in parafflin such as tissue from eyes, intestine, kidney, brain, heart, prostate, lung, breast or liver, histologic object slides, and all their possible combinations. The sequences of the invention are

The invention relates to a nucleic acid comprising a sequence of at least 18 bases of a segment of chemically pretreated DNA of genes associated the chemical signal sign. The activity of the modified sequences of the invention may be described as cytostatic. The object of the invention is to provide the chemically modified DNA of genes associated with cell signalling, as well as oligonucleotides and/or bNA-oligomers for detecting cytosine methylations, as well as a method which is particularly suitable for the diagnosis and/or therapy of genetic and epigenetic parameters of genes associated with cell signalling. The chemically modified DNA provided by the invention is useful for diagnosis and therapy of diseases such as solid tumours and cancer. The sequences given in records ABL70111-ABL70626 represent chemically pre-treated genomic DNA's of genes associated with cell signalling. Note: The sequence data for this patent is not represented in the printed sequence data for this patent is not represented in the printed provided by the constitution supplied by the

The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to acid sequences from mouse and human (ADA01482-ADA03094), and to caccombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a character of the protein, and a blochip comprising CA nucleic acid or CA nucleic acid, a polypeptide (especially an antibody) that specifically concogenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a circumparance of the effects of proviral integration into host protonocogenes. The CA nucleic acids of proviral integration into host carcinoma (especially breast cancer, prostate cancer, lymphoma or carcinoma is propensity to carcinoma by determination of the sequence of the invention of CA gene expression in particular cissues. CA nucleic acids, proteins and antibodies are also useful as thermal sequence represents a specifically claimed human CA nucleic acid cancer is a specifically claimed human CA nucleic acid cancer is the complete sequence data for this cancer is a specification, but was obtained in a lorency of the printed specification, but was obtained in a lorency of the concept of the carcinoma cancer is the complete sequence of the inventual transmitted or the printed specification, but was obtained in all not form part of the printed specification, but was obtained cancer in the complete sequence of the inventual cancer is the complete sequence of the carcinome of the printed specification, but was obtained to the carcinome of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          36015 rchadchadrdhahadachadchadadhahadagadhararrigchadrdharrard 35956

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 TCAAGAAAGTGAAAACACACACCGCAGAAGCAATAAAAATGTCTGTAAGTCATGTATCCG 60
                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polymucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, anothers, neoplasm, adenocarcinoma, and sarcommas. The present sequence represents a human gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                   recombinant nucleic acid, useful for treating carcinomas, lymphomas,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 72332 BP; 16680 A; 18843 C; 19431 G; 16654 T; 0 U; 724 Other;

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) anno acid sequences given in AAM92170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or delactions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polymucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the concleic acids into a host cell and culturing the used to provent, adjagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 concers and cancer human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 crepresent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4021 rcaaaaaagrgaaaagacaacrcacagaaagggagaaaarrrrgcaaarcargrarcrg 3962
                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 TCAAGAAAGTGAAAACACAACAGCAGAAGCAATAAAAATGTCTGTAAGTCATGTATCCG

```

human immune/hematopoietic antigen polypeptides, diagnosing and/or treating cancers and metastasis. Nucleic acids encoding useful for preventing,

Disclosure, SEQ ID NO 32543; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I)

   proteins and polynuclectides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) or polynuclectides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynuclectides may be used to prevent, cancers and cancer metastases of haematopoietic-delived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK5950 and AAM82169 crepresent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                 The present invention relates to a method (M1) for determining a predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from uPA (Urokinase plasminogen activator), SNGG (gamma-synuclein), IDE (insulinlypase), and TNRRSF6 (Thmour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the occurrence of neurodegenerative disease. The genes are all located on chromosome 10. M1 is useful for determining a predisposition for or the occurrence of and for treating neurodegenerative disease, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                   Determining a predisposition for or the occurrence of neurodegenerative disease, e.g. Alzheimer's disease by detecting in a target nucleic acid the presence or absence of an allelic variant of one or more polymorphic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method (M1) for determining a predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from UPA (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulindegrading enzyme), KNBLI (Kinesin-like protein I), LIPA (lysosomal acid lypase), and INRESF6 (Tumour Necrosis Factor Receptor-SPG), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             09
                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining a predisposition for or the occurrence of neurodegenerative disease, e.g. Alzheimer's disease by detecting in a target nucleic acid the presence or absence of an allelic variant of one or more polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 occurrence of neurodegenerative disease. The genes are all located on chromosome 10. MI is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 TCAAGAAAGTGAAAACACAACCCGCAGAAGCAATAAAAATGTCTGTAAGTCATGTATCCG

The present invention describes primer sets for synthesisting bould this.

[any an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polyuacleotide which comprises one of the 5602 mucleotide sequences defined in the specification, where the complementary strand of a polyuacleotide which comprises one of the 5602 mucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 mucleotides; or (b) a combination of a noligonucleotide comprising a sequence complementary to the complementary strand of a polyuacleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a complementary strand of a polyuacleotide which comprises a 1'-end sequence complementary to a complementary strand of a sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in cypecification. The primer sets can be used in antisense therapy and in cypecification and/or diagnosis of the abnormality of the proteins encoded by the full-length cDMAs. The primers are also betaining of the full-length cDMAs assily without any specialised methods. AAH33612 for AAH33623 represent human amino acid sequences; and AAH33622 represent compleotides.

Coligonucleotides, all of which are used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  104723 TCAAGAAAGTGAAAAGACAAACCTATAGAATGGCATAAAATATTTGTAAATCATATATCTG 104782
                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method (M1) for determining a predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or abone or an allelic variant of one or more polymorphic regions of one or more genes selected from UPA (Urokinase plasminogen activator), SNGG (gamma-synuclein), IDE (insulindegrading enzyme), KNSII (Kinesin-like protein 1), LIPA (lysosomal acid lypase), and TNPRSF6 (Tumour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the occurrence of neurodegenerative disease. The genes are all located on chromosome 10. M1 is useful for determining a predisposition for or the occurrence of and for treating neurodegenerative disease, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                detection; diagnosis; antisense therapy; gene therapy; ss.

The present invention describes primer sets for synthesising 5602 full-

[1 ength cDNAs defined in the specification. Where a primer set comprises:

[2 [2 [3] an Oligo-dr primer and an oligonucleotide comprisentary to the

[3 [3] complementary strand of a polynucleotide which comprises one of the 5602

[3 [3] complementary strand of a polynucleotide which comprises one of the 5602

[4 [3] complementary strand of a polynucleotide which comprises a formal of a polynucleotide comprising a sequence complementary to the

[5 [5] complementary strand of a polynucleotide which comprises a 5'-end

[5 [5] complementary strand of a polynucleotide which complementary to a sequence and an oligonucleotide comprises a 3'-end sequence, where the

[5 [5] complementary strand of a polynucleotide on the sequence of polynucleotide which comprises at least 15 nucleotides and the comblementary to a polynucleotide which comprises at least 15 nucleotides and the combination of the 5'-end sequence 5'-end sequence 5'-end sequence 5'-end sequence 6's end sequence 6's end sequence 6's end sequence 6's particularly full-length cDNAs. The primers are also useful for the comprises and comprises are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs and primers allow obtaining of the full-length cDNAs and sequences; AAH13632 to AAH13632 represent human amino acid sequences; and AAH13632 to AAH13632 represent complementary and an eused in the exemplification of the complementary and an eused in the exemplification of the complementary and an eused in the exemplification of the complementary and an eused in the exemplification of the complementary special and the complementary and and and sequences and AAH13632 to AAH13632 represent the complementary and and the complementary and and the complementary and sequences and the complementary and the complementary and the complementary and the complementary 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 8; SEQ ID NO 17007; 2537pp + Sequence Listing; English.

/clone="vector: pHGS2; Site 1: BstXI; Total genomic DNA was isolated from early log phase trophozoites of E. invadens isolated from plant DNA extraction kit. A shotgum medium-size plasmid library (average insert size of 10 - 12 kb) was generated by random mechanical shearing of E. invadens genomic DNA, repairing the ends of DNA fragments with T4 Polymerase, adding BstXI adaptors and ligating into the BstXI site of a pUC-derived vector pHOS2."
